Oxycodone: Uses, Safety, Risks & Responsible Use

Oxycodone is a prescription opioid medication used to manage certain types of moderate to severe pain. Because it can cause drowsiness, dependence, and potentially dangerous breathing problems, it should only be used exactly as prescribed by a qualified healthcare professional.

Important: Oxycodone is a controlled prescription medication. Never use someone else's prescription or change your dose without speaking with your healthcare professional.

What Is Oxycodone?

Oxycodone works on opioid receptors in the nervous system to reduce the perception of pain. It may be prescribed in different formulations and strengths depending on the patient's condition and medical needs.

How Should Oxycodone Be Used?

Follow the prescription label and your healthcare professional's instructions carefully. Do not take more than prescribed, take it more frequently than directed, or combine it with other substances unless your healthcare professional has confirmed that doing so is safe.

- Take only the prescribed amount.
- Do not share your medication with another person.
- Keep the medication secured and away from children.
- Do not suddenly change long-term use without medical guidance.
- Ask a pharmacist about interactions with other medicines.

Common Side Effects

POWERED BY

Important Safety Risks

Never mix oxycodone with alcohol, sedatives, or other medications that can slow breathing unless specifically instructed by a healthcare professional.

Opioids can cause respiratory depression, overdose, physical dependence, and addiction. The risk can be greater when the medication is taken in higher amounts than prescribed or combined with other central nervous system depressants.

Recognizing a Possible Overdose

Extremely slow or stopped breathing, inability to wake the person, unusual snoring or gurgling sounds, and blue or gray lips or skin can indicate an opioid overdose.

If an overdose is suspected, seek emergency medical assistance immediately. If naloxone is available and appropriate, use it according to its instructions while emergency help is being obtained.

Talk With a Healthcare Professional

If you have questions about oxycodone, pain treatment, side effects, interactions, or stopping the medication, speak with your doctor or pharmacist. They can help determine the safest treatment approach for your individual situation.
